

Paul Withers  
Lunar and Planetary Laboratory  
University of Arizona  
Tucson AZ 85721  
2002.11.10

To: Visiting Scientist Selection Committee  
Program in Atmospheric and Oceanic Sciences  
Princeton University

In response to your recent advertisement in Eos, I would like to be considered for a postdoctoral position.

I enclose:

- 3 page application form
- 2 page research proposal
- 5 page CV and publication list
- 4 reprints of published papers
- 1 manuscript currently under review by Icarus

I have arranged for my referees (Stephen Bougher, Greg Neumann, and John Wilson) to send letters directly to you.

Thank you,

Paul Withers

## Atmospheric Tides

My research aims are focused towards improving our understanding of atmospheric tides. Atmospheric tides transport energy and momentum vertically within an atmosphere. Due to their modification of the background thermal structure, they can be an important component of atmospheric circulation. At AOS/GFDL, the research areas of both the Weather and Atmospheric Dynamics and the Atmospheric Physics and Chemistry groups include processes related to atmospheric tides. I plan to collaborate closely with John Wilson.

### **Broad Goals:**

- (1) Studies of tides in the martian upper atmosphere [Keating *et al.*, 1998; Withers *et al.*, 2002].
- (2) Studies of tides in the martian lower atmosphere, in conjunction with the upper atmospheric results of goal 1, to test theories of how it is dynamically coupled to the upper atmosphere [Banfield *et al.*, 2000; Hinson *et al.*, 2001].
- (3) Compare tidal observations to John Wilson's General Circulation Model simulations to test theories of how atmospheric tides are generated [Wilson and Hamilton, 1996].

### **Background:**

Atmospheric tides are departures from a mean, static behaviour with a harmonic relation to diurnal solar forcing. Solar heating is stronger in the atmosphere of Mars than Earth's, per unit mass, and this causes strong thermal tides [Zurek *et al.*, 1992]. Different tidal modes have specific zonal wavenumbers and periods which define their vertical and meridional structure. They originate at the planet's surface, and propagate upwards, affecting the transport of energy and momentum in the atmosphere. Tides should increase in amplitude as they propagate upwards, but are dissipated to varying degrees dependent on the lower atmospheric winds and their vertical wavelength [Forbes, 1995]. Mars Global Surveyor (MGS) accelerometer data have shown that tides are immensely important in the martian upper atmosphere, causing longitudinal variations in density of a factor of two or more [Keating *et al.* 1998; Withers *et al.*, 2002]. Since the tides are affected by the lower atmosphere as they propagate upwards to the upper atmosphere, observations of upper atmospheric tides contain information about the state of the lower atmosphere. For example, eastward winds in the lower atmosphere prevent the existence of stationary Rossby waves, a specific tidal mode, in the upper atmosphere [Joshi *et al.*, 2000].

### **Specific Objectives in each Goal:**

- (1) I plan to quantify the longitudinal structure, caused by thermal tides, in the martian upper atmosphere seen in neutral and electron density data from MGS and Mars Odyssey as a function of latitude, altitude, season, time of day, and phase in the 11 year solar cycle, and identify the dominant tidal modes [Keating *et al.*, 1998; Bougher *et al.*, 2001; Withers *et al.*, 2002].
- (2) I will then study tidal signatures in the lower and middle atmosphere using measured temperature profiles from other instrument, identifying their vertical wavelengths,

meridional structure, and time of day dependence. The lower and upper atmospheric results will then be compared to test whether simple, classical theories of tidal propagation are adequate to explain the observations or whether more detailed theories are needed.

(3) By comparing lower and upper atmospheric measurement of tidal signatures to John Wilson's simulations from a general circulation model, we can test how completely current models reproduce all the processes affecting atmospheric tides. Of particular interest is how the tides are generated near the surface. Topography, rather than any other spatially non-uniform surface physical property such as thermal inertia, is likely to play the dominant role in modulating solar forcing to generate these non-migrating tides, but this process has not been completely studied yet [Wilson and Hamilton, 1996; Withers *et al.*, 2002]. Wilson and I will test whether topography is responsible for all the tidal modes in the upper atmosphere, how the dominant tidal modes change with seasonal changes in atmospheric circulation, and how well simulations can reproduce the observations. An important goal is to test whether observations of upper atmospheric tides, which have propagated upwards through the lower atmosphere, can also reveal useful information about the thermal structure and circulation in the lower atmosphere. Finally, insight into tidal processes from another planet can be applied to problems in terrestrial geophysical fluid dynamics.

Lunar and Planetary Laboratory  
University of Arizona  
Tucson  
AZ 85721

Tel: (520) 621 1507  
Fax: (520) 621 4933  
Email: withers@lpl.arizona.edu  
Citizenship: British

### **Education**

---

- PhD, Planetary Science, University of Arizona 2003(planned)  
All requirements, except thesis, satisfied. Completion expected in late spring.
- MS, Physics, Cambridge University, Great Britain 1998
- BA, Physics, Cambridge University, Great Britain 1998

### **Professional Experience**

---

- Graduate research assistant Dr. Stephen Bougher (Univ. of Arizona) 1998 – present  
Studied weather in the martian upper atmosphere. Played an advisory role in mission operations for Mars Global Surveyor and Mars Odyssey aerobraking
- Research consultant Dr. John Zarnecki (Open University) 2001(summer)  
Worked in Great Britain, developed techniques to analyze accelerometer data from entry probes, concentrating on the British Beagle 2 Mars Lander.
- Research assistant Dr. Greg Neumann (NASA/Goddard) 2000(summer)  
Worked with MOLA team to investigate the geology of the northern plains of Mars, supported by the competitive Goddard Summer Student Program.
- Research assistant Dr. Andrew Melatos (Caltech) 1997(summer)  
Modeled pulsar outflows, supported by a competitive Caltech Summer Undergraduate Research Fellowship.
- Website designer Dr. Nicholas Walton (ING) 1996(summer)  
Worked at the Isaac Newton Group (ING) of Telescopes, La Palma, Spain.

### **Fellowships, Honors, and Awards**

---

- Kuiper Memorial Award from the University of Arizona for excellence in academic work and research in planetary science. 2002
- Nominated for the Meteoritical Society/Geological Society of America's Best Student Paper in Planetary Sciences Award. 2002
- Galileo Circle Graduate Scholarship from the University of Arizona. 2001
- Highly Commended in annual British Young Science Writer Contest. 2000
- Graduate Registration Fellowships from the University of Arizona. 1999 – 2002

### **Research Interests**

---

- Current research interests include the dynamics of upper atmospheres, accelerometer data analysis, historical astronomy, and martian tectonism. Future research directions will include the outer solar system, building on the results of Galileo and preparing for Cassini.

## Professional Activities

---

- NASA 2003 Mars Rovers – Atmosphere Science Advisor for Landing. 2002(selected)
- Author of publicly available programs to analyze entry accelerometer data (<http://www.lpl.arizona.edu/~withers/beagle2/>). 2002
- Attended two-week Summer School on Planetary Geology in Italy. 2002
- Reviewer for *Icarus*, *Meteoritics and Planetary Science*, and *Science*. 2001 – present
- PI and Co-I on 2 proposals to NASA, neither funded. 2001
- Community discussion forum moderator and member of community panel on Education/Public Outreach for Solar System Exploration Decadal Survey. 2001
- “Oceans on Mars” – invited colloquium at Imperial College, Great Britain. 2001
- Participated in PDS review of MGS accelerometer dataset (MGSA\_0002). 2000

## Teaching Experience

---

- Participated in the University of Arizona’s Scientist-Teacher Alliance, developed teaching plans and visited classrooms with middle school teachers. 2002
- Attended three national workshops on graduate student teaching. 2000 – 2002
- Teaching Assistant for Profs. John Lewis and Jonathan Lunine in introductory science classes for non-science majors, including lecturing on human evolution. 1999 – 2000

## Public Outreach

---

- Presentation on “Shallow Ridges on the Northern Plains of Mars” at a University of Arizona Open House Evening. 2001
- Media interviews about my research on the martian northern plains and lunar crater Giordano Bruno, featured on CNN, print, and online media. 2001
- Presentations on “The Martian Upper Atmosphere” and “The Age of Lunar Crater Giordano Bruno” at the University of Arizona’s Student Showcase, best presentation by a graduate student in the physical sciences in 1999. 1999 – 2000
- Named NASA’s Deep Space 2 Mars Microprobes *Scott* and *Amundsen*. 1999

## Geological Field Experience

---

- Organized short sections of the University of Arizona’s planetary geology fieldtrip each semester, planning field stops and leading discussions. Went on 9 geological fieldtrips around the southwestern US and nearby Mexico. 1998 – 2002
- Participated in week-long Cambridge University geological fieldtrip to study the tectonics of Greece. 1997

**Language Skills:** Proficient in written French. Conversational level in French and Spanish.

**Professional Affiliations:** Member of the American Geophysical Union’s Planetary Sciences Section, the American Astronomical Society’s Division for Planetary Science, and the British Planetary Forum.

## Publications
