The ionosphere of Mars and its importance for climate evolution
A community white paper for the 2009 Planetary Decadal Survey

Paul Withers (withers@bu.edu), Jared Espley, Rob Lillis, Dave Morgan and ~30 others

MEPAG meeting, 2009.07.29
Brown University, Providence RI
My objectives

• MAVEN is worthwhile
• Extension of MAVEN beyond nominal one Earth year duration will be extremely valuable
• The science of the ionosphere of Mars will not end with MAVEN
• Present some ideas for future ionospheric instruments and missions (with realism)
Structure of white paper

- Introduction
  - Ionospheres in general and the martian ionosphere in particular are great
- What MAVEN will do
  - Excellent neutral/plasma composition
  - First in-depth look at the nightside
  - Effects of magnetic topology
  - Boundary between ionosphere and solar wind
- Important questions that it is clear MAVEN will not answer
- Measurements to answer those questions
- Conclusions
Important questions that MAVEN’s nominal mission will not answer

- **Q1** - Solar cycle variations
- **Q2** - Below 125 km
- **Q3** - Links between solar forcing and ionospheric properties
- **Q4** - Temporal variations
- **Q5** - Global coverage
- **Q6** - Hot atom escape fluxes
- **Q7** - Dynamical coupling between neutral atmosphere and ionosphere
Desired measurements and instruments (1)

- M1 – High cadence magnetic field measurements from surface to study currents induced by plasma motion [surface magnetometer] (Q2, Q4)
- M2 – High cadence vertical profiles of bottomside electron density [surface ionosonde] (Q2, Q4)
- M3 – High cadence total electron content measurements [surface riometer] (Q4)
- M4 – All-sky camera images of airglow [simple surface camera] (Q4)
Desired measurements and instruments (2)

- M5 – Upstream measurements of solar wind and irradiance simultaneous with ionospheric measurements [various small instruments on an orbiter] (Q3)
- M6 – Spacecraft-to-spacecraft radio occultations [minor modification to typical comm system of orbiters] (Q5)
- M7 – Simultaneous neutral winds, ion velocities, plasma density and magnetic field [Fly CINDI payload from C/NOFS on Mars orbiter] (Q7)
Aeronomy Constellation Mission

- This is a PROGRAM - What missions will be inspired by MAVEN's discoveries?
- No chance of near-term flight, but a good place to plant idea of future mission-level concepts
- Upstream monitor of solar conditions, downstream observations of escaping volatiles, plus simultaneous observations of the ionosphere
